CATALYTIC ACTIVITY: ATP + UDP-N-ACETYLMURAMOYL + L-ALANINE
ADP + ORTHOPHOSPHATE + UDP-N-ACETYLMURAMOYL-L-ALANINE.

PATHWAY: PEEFTIDOGLYCAN BIOSYNTHESIS.

SUBCELLULAR LOCATION: CYTOPLASMIC (PROBABLE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   European
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SIMILARITY: BELONGS TO THE MURCDEF FAMILY.

CATALYTIC ACTIVITY: ATP + UDP-N-ACETYLMURAMOYL + L-ALA
ADP + ORTHOPHOSPHATE + UDP-N-ACETYLMURAMOYL-L-ALANINE.

PATHMAY: PEPTIDOGLYCAN BIOSYNTHESIS.

SUBCELLULAR LOCATION: CYTOPLASMIC (PROBABLE).

SIMILARITY: BELONGS TO THE MURCDEF FAMILY.
                                                                                                                                                   CNGCNYTNYTNACNGARTIYGCNGARWSNTTYCARGAYGCNGAYGTNGTNATHYTNCAYG

NUCLEIC ACIDS RES. 19:6027-6031(1991).
-1- FUNCTION: HAS BOTH ATPASE AND HELICASE ACTIVITIES. UNWINDS DNA
DUPLEXES WITH 3' TO 5' POLARITY WITH RESPECT TO THE BOUND STRAND
AND INITIATES UNWINDING MOST EFFECTIVELY WHEN A SINGLE-STRANDED
REGION IS PRESENT. INVOLVED IN THE POSTINCISION EVENTS OF
NUCLEOTIDE EXCISION REPAIR AND METHYL-DIRECTED MISMATCH REPAIR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EMBL; V00705; G13611;

The invention relates to a UDP-N-acetylmuramate:L-alanine ligase

(Murc polypeptide) encoded by the S. aureus Murc gene. Host cells

containing an expression system comprising the Murc gene can be used for

the recombinant production of the polypeptide. Agonists or the Murc

polypeptide are used to treat conditions requiring increased activity or

expression of the polypeptide. Antagonists, inhibitory nucleic acid or

competitive polypeptide are useful for inhibiting the polypeptide e.g.

competitive polypeptide are useful for inhibiting the polypeptide e.g.

bacterial (especially S. aureus) infections. They are also useful against

Helicobacter pylori infections and related cancers, ulcers and gastritis.

The antibacterial agents are useful to treat in-dwelling devices for

infection prevention or generally as wound treatments to prevent adhesion

of bacteria to matrix proteins. The Murc polypeptide is also useful for

PT Nucleic acid encoding antigenic peptide(s) from Streptococcus proneumoniae - or their epitope-containing fragments, useful in protective or therapeutic vaccines, and for diagnosis Claim 11; Page 73; 118pp; English.

CC The present sequence represents a protein from Streptococcus pneumoniae. The present sequence encoding the Streptococcus pneumoniae protein CC and be useful in vaccines for inducing protective antibodies against CC streptococcus pneumoniae, for treatment or prevention of infection e.g. pneumonia, oitiis media or meningitis. Probes based on the nucleic acid CC are used to detect Streptococcus infection (by usual hybridisation or CC amplification methods), also for isolating Streptococcus genes or their CC allelic variants. The protein can be used similarly to detect specific CC antibodies in standard immunoassays, especially for diagnosing or CC detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, CC g. by injection, orally or through the skin, typically at 0.01-1000 CC (especially 10-300) mu g/ml per dose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

ALIGNMENTS

PT New isolated MurC polypeptide from Staphylococcus aureus and related PT nucleic acid - useful in diagnosis, treatment and prevention of PT bacterial infections
Claim 1; Page 4; 39pp; English.

CC The present sequence represents a UDP-N-acetylmuramate:L-alanine ligase CC (MurC polypeptide) encoded by the S. aureus MurC gene. Host cells containing an expression system comprising the MurC gene can be used for the recombinant production of the polypeptide. Agonists or the MurC CC polypeptide are used to treat conditions requiring increased activity or CC polypeptide are useful for inhibiting the polypeptide or competitive polypeptide are useful for inhibiting the polypeptide acid or CC competitive polypeptide are useful for inhibiting the polypeptide e.g. CC bacterial (especially S. aureus) infections. They are also useful against CC Helicobacter pylori infections and related cancers, ulcers and gastritis. CC Helicobacter pylori infections are useful to treat in-dwelling devices for infection prevention or generally as wound treatments to prevent adhesion CC diagnosing or prognosing a (susceptibility to) disease, for raising CC diagnosing or prognosing a (susceptibility to) disease, for raising continuously design and as an immunogen for vaccines. The MurC gene sequences are CC useful in antisense/ribozyme therapeutics; to detect mutant MurC gene; for the continuously design and as an immunogen for vaccines. The MurC gene sequences are continuously design and as an immunogen for vaccines. The MurC gene sequences are continuously design and as an immunogen for vaccines. The MurC gene sequences are continuously design and as an immunogen for vaccines. The MurC gene sequences are continuously design and sequences are continuously design and sequences are continuously design and sequences are continuously design and sequences are continuously design and sequences are continuously design and sequences are continuously design and sequences are continuously design and sequences are continuously design and sequences are 07-JAN-1999.

Pred. No. is the nu score greater than and is derived by a

is the number of results predicted by chance to have a ater than or equal to the score of the result being printed, rived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                               histologically-determined to be fully malignant prostate cancer cells. Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /organism-"Homo sapiens"
